**Topics on Concentration Phenomena and Problems with Multiple Scales** Feb 23 2022 The study of variational problems showing multi-scale behaviour with oscillation or concentration phenomena is a challenging topic of very active research. This volume collects lecture notes on the asymptotic analysis of such problems when multi-scale behaviour derives from scale separation in the passage from atomistic systems to continuous functionals, from competition between bulk and surface energies, from various types of homogenization processes, and on concentration effects in Ginzburg-Landau energies and in subcritical growth problems.

**Cases and Problems in Contemporary Retailing** Jun 25 2019 The book provides thirty cases from which to choose. Each of the cases is based on real situations-no armchaired situations exist. The cases are long enough to give adequate data for analysis but not so long so as to be cumbersome. The number and variety of cases, issues, types of operations, levels of sophistication, levels of management addressed, and so forth, assure that this book can be used at any level by any instructor who believes in and appreciates the value of case analysis as a teaching technique. Discussion Motivators are included in Appendix B. This component fills a market demand for increasing class interaction on topics which are difficult to cover in any other way. The book also contains numerous problems for practice, illustrations, and homework.

**HYDROGEOLOGY: PROBLEMS WITH SOLUTIONS** Sep 20 2021 Numerical calculations are inevitably required in the field of hydrogeology and play a significant role in dealing with its various aspects. As often as not, students are seen struggling while solving numerical problems based on hydrogeology, as they find difficulty in identifying the correct concept behind the problem and the formula that can be applied to it. Also, there is a dearth of books, which help the readers in solving numerical problems of varied difficulty level and enable them to have a firm grounding in the subject of hydrogeology. The book Hydrogeology: Problems with Solutions fills this void in the finest way, and as desired, chiefly focuses on the sequential steps involved in solving the problems based on hydrogeology. It concisely covers the fundamental concepts, advanced principles and applications of hydrogeological tasks rather than overemphasising the theoretical aspects. The text comprises sixty solved hydrogeological problems, which are logically organised into ten chapters, including hydrological cycle, morphometric analysis, hydrological properties, groundwater flow, well hydraulics, well design and construction, groundwater management, seawater intrusion, groundwater exploration and groundwater quality. The practice of pedagogy of hydrogeology in yesteryears was a two-tier approach of theoretical principles with toy problems and in-situ case studies for research start-up. This book bridges the gap between routine problem-solving and state-of-the-practice for future. The book is primarily intended for the undergraduate and postgraduate students of Earth Sciences, Civil Engineering, Water Resources Engineering, Hydrogeology and Hydrology. It also serves as an excellent handy reference for all professionals. KEY FEATURES • Key Concept succinctly explores the models, methods and theoretical concepts related to each problem. • Necessary equations and formulae are specified. • Appendices and Glossary are included, leaving no scope to refer any other book. • Bibliography broadens the scope of the book.

**Numerical Methods for Elliptic Problems with Singularities** Apr 15 2021 This book presents two kinds of numerical methods for solving elliptic boundary value problems with singularities. Part I gives the boundary methods which use analytic and singular expansions, and Part II the nonconforming methods combining finite element methods (FEM) (or finite difference methods (FDM)) and singular (or analytic) expansions. The advantage of these methods over the standard FEM and FDM is that they can cope with complicated geometrical boundaries and boundary conditions as well as singularity. Therefore, accurate numerical solutions near singularities can be obtained. The description of methods, error bounds, stability analysis and numerical experiments are provided for the typical problems with angular, interface and infinity singularities. However, the approximate techniques and coupling strategy given can be applied to solving other PDE and engineering problems with singularities as well. This book is derived from the author's Ph. D. thesis which won the 1987 best doctoral dissertation award given by the Canadian Applied Mathematics Society. Contents: Introduction Part I: Boundary Methods for Solving Laplace's Boundary Value Problems with Singularities A Complicated Problem Solved by Boundary Methods Boundary Methods for Interface Problems Part II: The Nonconforming Combination of the Ritz-Galerkin and Finite Element Methods The Nonconforming Combinations for Infinite Domain Problems The Nonconforming Combinations for Interface Problems The Nonconforming Combination of the Ritz-Galerkin and Finite Difference Methods References, Index Readership: Computer scientists, applied mathematicians and engineers. Keywords: Elliptic Problems; Finite Element Method; Finite Difference Method; Ritz-Galerkin Method; Boundary Element Method; Least Squares Method; Singularity Problems; Boundary Methods; Nonconforming Combinations

**Problems with a Point** May 05 2020 Ever notice how people sometimes use math words inaccurately? Or how sometimes you instinctively know a math statement is false (or not known)? Each chapter of this book makes a point like those above and then illustrates the point by doing some real mathematics through step-by-step mathematical techniques. This book gives readers valuable information about how mathematics and theoretical

computer science work, while teaching them some actual mathematics and computer science through examples and exercises. Much of the mathematics could be understood by a bright high school student. The points made can be understood by anyone with an interest in math, from the bright high school student to a Field's medal winner.

**Nonsmooth Approach to Optimization Problems with Equilibrium Constraints** Dec 24 2021 In the early fifties, applied mathematicians, engineers and economists started to pay close attention to the optimization problems in which another (lower-level) optimization problem arises as a side constraint. One of the motivating factors was the concept of the Stackelberg solution in game theory, together with its economic applications. Other problems have been encountered in the seventies in natural sciences and engineering. Many of them are of practical importance and have been extensively studied, mainly from the theoretical point of view. Later, applications to mechanics and network design have led to an extension of the problem formulation: Constraints in form of variational inequalities and complementarity problems were also admitted. The term "generalized bilevel programming problems" was used at first but later, probably in Harker and Pang, 1988, a different terminology was introduced: Mathematical programs with equilibrium constraints, or simply, MPECs. In this book we adhere to MPEC terminology. A large number of papers deals with MPECs but, to our knowledge, there is only one monograph (Luo et al., 1997). This monograph concentrates on optimality conditions and numerical methods. Our book is oriented similarly, but we focus on those MPECs which can be treated by the implicit programming approach: the equilibrium constraint locally defines a certain implicit function and allows to convert the problem into a mathematical program with a nonsmooth objective.

*Solving Optimization Problems with MATLAB®* May 29 2022 This book focuses on solving optimization problems with MATLAB. Descriptions and solutions of nonlinear equations of any form are studied first. Focuses are made on the solutions of various types of optimization problems, including unconstrained and constrained optimizations, mixed integer, multiobjective and dynamic programming problems. Comparative studies and conclusions on intelligent global solvers are also provided.
